C:Comment: This enzyme is involved in the pentose phosphate pathway. It plays roles
wall constituents, and production of NADPH for reductive blosynthesis.
                                                                                                                                                                                                                                                                                                                                   ö

Solida membrane protein YOR267c - yeast (Saccharomyces cerevisiae)

N. Alternate names: hypotherical protein 05420
C. Species: Saccharomyces cerevisiae protein 05420
C. Accession: S67164; S67169; S72039
S. Submitted to the Protein Sequence Database, July 1996
A. Mccession: S67164
A. Molecule type: DNA
A. Residues: 1-75 - 20419
A. Mccession: S67169
A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Accession: Fruit fly (Drosophila melanogaster) (fragments)

TITLE OF INVENTION: NOVEL SERINE PROTEASE REAGENTS
TITLE OF INVENTION: AND METHODS USEFUL FOR DETECTING AND TREATING DISEASES NUMBER OF SEQUENCES: 76
                                                                                                         ÷
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                       Sequence 7, Application US/09261416A
Patent No. 6291663
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: O'Brien, Timothy J.
APPLICANT: Underwood, Lowell J.
TITLE OF INVENTION: TADG-12: A No. 6291663el Transmembrane Serine Protease
FILE REFERENCE: D6192
CURRENT APPLICATION NUMBER: US/09/261,416A
CURRENT APPLICATION NUMBER: US/09/261,416A
SEQ ID NOS: 14
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FEATURE: OTHER INFORMATION: Serine protease catalytic domain of stratum corneum OTHER INFORMATION: chymotryptic enzyme (Scce) homologous to similar OTHER INFORMATION: domain in TADG-12
                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                         .;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 12, Application US/09154344

Patent No. 5981256

GENERAL INFORMATION:
APPLICANT: Egelrud, Torbjorn
APPLICANT: Hansson, Lennart
TITLE OF INVENTION: Recombinant Stratum Corneum Chymotryptic
TITLE OF INVENTION: Enzyme (SCCE)
NUMBER OF SEQUENCES: 17
CORRESPONDENCE ADDRESS:

0
         The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonucleotide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin ensyme (SCCE).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human tumour antigen-derived gene 15 (TAMO-15) protein and coding sequence (see AAH33601 and AAB98500).
TAMG-15 is an extracellular serine protease. It was found that TAMG-15 is over-expressed in ovarian tumours. TAMG-15 protein or its fragments of 9-20 residues that lack TAMG-15 protease activity are useful for vaccinating an individual against TAMG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TAMG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TAMG-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel extracellular serine protease, termed tumor antigen-derived gene 15 protein overexpressed in carcinomas and DNA encoding it, for diagnosis, treatment, prevention of cancer, particularly breast,

The present sequence is human stratum corneum chymotryptic enzyne (HSCEE), a member of the kallikrein multi-gene family. Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-L1, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New kallikrein-like (KLK-L) proteins for diagnosing and treating KLK-L protein mediated disorders, especially cancer. -
                                                                                                                                                                                                     Recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                     the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAT39783) obtd. from a human lung library. Recombinar protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cods. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; KLK-L1; KLK-L2; KLK-L3; KLK-L4; KLK-L5; KLK-L6; HSCEE;

                                                                                                                                                                                                                                             XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention.
                                                                                                                       ö
treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not appear in the printed

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE ollagonicalectide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an epitode selected from those represented by peptides ANG98812-799339 which are derived from those representative of the world wide population. The peptide/analogue blids to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce to variably selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune circated using the peptide containing pharmaceutical include autoimmune circated using the peptide or ontaining pharmaceutical include autoimmune circated using the peptide containing pharmaceutical include autoimmune containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthania containing pharmaceutical include autoimmune post-streptococcal endocarditis or glomerulonephritis and food inseases (rheumatoid arthritis, multiple sclerosis, and myasthania constructions and influence and post-streptococcal endocarditis or glomerulonephritis and food hypersensitivities. The peptide epitopes can be used to enhance immunogens administered with the peptides may corstate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, corresponses and conditions, immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be used to make monoclonal antibodies may also be used to make monoclonal antibodies may be used to make monoclonal antibodies may be used to make monoclonal antibodies may also be used to make monoclonal antibodies conserved correspents. For example, to determine the susceptibility of an individuals will be at substantial fisk of development of epitope based vaccines particularly towards co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

```
comprising a unit dose form of a peptide, or analogue, comprising an epitope selected from those represented by peptides AAY98812-Y99339 which are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue binds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nm. The pharmaceutical can be used to induce a halper T cell response. The pharmaceutical focuses the immune response towards selected determinants and could therefore be used in cases of them or could viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia (gravis), allograft rejection, allergies, lyme disease, hepatitis, post-streptococcal endocarditis or glomerulonephritis and food hypersensitivities. The peptide epitopes can be used to enhance immune processes and enhance inmune processes and enhance in the peptide enhance in the processes of the rimmunogens administered with the peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, and condyloma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic reagents, for example, to determine the susceptibility of an individual individuals will be at substantial risk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence
                                                                                                               immune response; chronic viral disease; cancer; autoimmune disease; rheumatoid arthritis; multiple sclerosis; mysthenia gravis; AIDS; allograft rejection; allergy; lyme disease; hepatitis; prostate cancer; glomerulonephritis; food hypersensitivity; malaria.

```
The present invention relates to a new pharmaceutical composition comprising a unit dose form of a peptide, or analogue, comprising an experience of comprising an experience of the peptides Angy8812-199339 (which are derived from those represented by peptides Angy8812-199339 (which are derived from various antigens for various human leucocyte antigen class DR molecules, representative of the world wide population. The peptide/analogue bluds to an HLA class II molecule at an IC-50 of less than or equal to 1,000 nM. The pharmaceutical can be used to induce a helper T cell response. The pharmaceutical focuses the immune response to towards selected determinants and could therefore be used in cases of chronic viral diseases and cancer. Examples of diseases that can be treated using the peptide containing pharmaceutical include autoimmune diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia crosses selection arthritis, multiple sclerosis, and myasthenia gravity allograft rejection, allergies, lyme disease, hepatides. Oper-streptococcal endocarditis or glomerulonephritis and food hypersensitivities. The peptide epitopes can be used to enhance immune response against other immunogens administered with the peptides. Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatidis by hepatitis C, AIDS, renal carcinoma, corresponses and conditions, lymphoma, and condyloma acuminatum. The peptides may also be useful as pidenostic or therapeutic agents. The peptides may also be useful as diagnostic cervical carcinoma, lymphoma, and condyloma acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic cervical carcinoma. Also, the peptides may be used to predict which are characterized by high sequence development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence cervican and also and malaria.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 31; DB 21

PRARA RABERTAR AND SALITIFICATION OF STREET ```

Endress GA;

WPI; 1998-506364/43. N-PSDB; AAV59803.

New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

Claim 1; Page 701; 721pp; English.

This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 176 from the human cDNA clone HFTBR48 (deposited as clone ATCC 97904 and ATCC 209050).

The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only.

 acid sequences: AAVS5511-V59812: amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which tissues they are most highly expressed in (see AAV59511 for described uses).
The invention relates to 186 novel genes and their fragments (nucleic

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (1)
amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic
activity, and can be used in gene therapy and vaccine production. (I)
critical and polynucleotides may be used in the prevention, diagnosis and
treatment of diseases associated with inappropriate (I) expression. For
example, they may be used to treat disorders associated with decreased
cxpression by rectifying mutations or deletions in a patient's genome
that affect the activity of (I) by expressing inactive proteins or to
supplement the patients own production of (I). Additionally, (I)
c supplement the patients own production of (I). Additionally, (I)
the nucleic acids into a host cell and culturing the cell to express the
protein. (I) proteins and polynucleotides may be used to prevent,
clagnose and treat immune/haematopoietic-related diseases, especially
cancers and cancer metastases of haematopoietic-derived cells. AAK64703
to AAK87694 represent human immune/haematopoietic antigen genomic
sequences from the present invention. AAK54942 to AAK54950 and AAM82169
crepresent sequences used in the exemplification of the present invention.

Sequences ABB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides, antibodies against the polypeptides, methods of detecting the nucleotides or polypeptides of the invention. Although novel, many of the bolypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence to potential therapeutic applications. The polypeptides of the invention may giving an insight into their probable biological activities, and hence to potential therapeutic applications. The polypeptides of the invention may have various activities; including cytokine, cell proliferation or cell differentiation activities, including cytokine, cell proliferation or cell confinence activities; nemocratic, thrombotic or thrombolytic activities; receptor or ligand activities; or may be convoluted in oncogenesis, cancer cell proliferation or metastasis.

Compending on their biological activities, haemostatic, thrombotic or the invention are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Such conditions include cancers, haematopoletic disorders (e.g., myeloid or lymphoid cell cancers, haematopoletic unpanatory conditions (e.g., asthma or arthritis), proliferative retinopathy, atherosclerosis, coronary heart disease,

 vascular growth. Polypeptides involved with tissue regeneration and repair (or nucleic acids encoding them) may be used to promote wound healing (e.g., of burns, incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, bacterial and fungal infections in addition to immune disorders. Polypeptides with growth factor activity may be used in cell cultures to promote cell growth. For example, such polypeptides may be used to manipulate stem cells in culture to give rise to neuroepithelial cells that can be used to augment or replace cells damaged by illness, autoimmune disease or accidental damage. The polypeptides and nucleotides may also be used in the diagnosis of the above conditions, and in drug screening techniques. The present sequence represents a novel human

encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerledies are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
 ; expressed sequence tag; secreted protein; cDNA isolation; chromosome mapping.
 The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences darived from the 5' ends of mRNAs and even in those cases where longer CDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
 Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication.

 The sequences given in AAR99483-85 represent proteins from the pentachlorophenol (PCP) breakdown pathway, designated PCPC, PCPA and PCPE Respectively. This sequence represents the protein tetrachlorophydroquinone reductase. PCpA has a mol. wt. of approce. 30000 and is hydroquinone reductase. PCpA has a mol. wt. of approce. 30000 and is thought to be involved in PCP breakdown either at the stage of PCP uptake into the cell or as a component of a PCP-degrading enzyme complex. PCpB and PCPC are enzymes which catalyse successive steps in the PCP breakdown pathway of Flavobacterium. PCpB catalyses the conversion of PCP to 2,3,5,6-tetrachloro-p-hydroquinone (TCCH) in the presence of NADPH and oxygen. It has a mol. wt. of 59-63 kD. In the presence of the reduced form of glutathione, PCP Catalyses the conversion of TCCH to 2,3,6-trichloro-p-hydroquinone (TCCH) and the conversion of TCCH to 2,3,5-trichloro-p-hydroquinone (TCCH) and the conversion of TCCH to 2,3,5-trichloro-p-hydroquinone (TCCH) and the conversion of TCCH to 2,3,6-trichloro-p-hydroquinone (TCCH) as a mol. wt. of 26-29 kD. In combination these enzymes catalyse the initial steps of PCP breakdown. These enzymes catalyse the conversion of PCP broakdown. These enzymes can specifically be environment and in food chains after its use in the wood preserving however and perfect its use in the wood preserving changes as a fungleide and pesticide, and in products such as

 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The carbon did in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disoughers involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of disorders or other traits to assess biodiversity and to produce other types of dasorders are disordered in or or of sequences. Associated and products dependent on DNA and cannon acid sequences of the invention.
 ö
 Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

This protein sequence comprises the novel multidomain human phosphoprotein TRIO, which is suggested to be a central organiser of multiple signaling pathways, to be involved in the activation of concogenes such as c-fos, and to induce transformation of cells. The amino acid sequence was deduced from a composite of cDNA clones obtained from human WI-38 fibroblast cDNA by interaction trap assay. TRIO mRNA was expressed in all 8 human tissues examined. Once isolated, TRIO DNA can be expressed in usual host/vector systems to produce recombinant TRIO polypeptides, e.g. for antibody production or screening for modulators of activity. Labelled antibodies that

 The present invention describes the human Zmax1 gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmax1 and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, solerostosis, osteomalacia and fibrous dysplasia. ABA82038 to ABA82700 and AAG68168 to AAG68193 represent sequences used in the exemplification of the present invention.

 The present invention relates to a new pharmaceutical composition

comprising a unit dose form of a peptide, or analogue, comprising an
epitope selected from those represented by peptides AAY98812-Y99339
which are derived from ware represented by peptides AAY98812-Y99339
which are derived from ware representative of the world wide population.

The peptide/analogue binds to an HLA class II molecule at an IC-50 of
less than or equal to 1,000 nm. The pharmaceutical can be used to induce
a helper T cell response. The pharmaceutical focuses the immune response
towards selected determinants and could therefore be used in cases of
chronic viral diseases and cancer. Examples of diseases that can be
treated using the peptide containing pharmaceutical include autoimmune
diseases (rheumatoid arthritis, multiple sclerosis, and myasthenia
gravis), allograft rejection, allergies, lyme disease, hepatitis,
post-streptococcal endocarditis or glomerulonephritis and food
hypersensitivities. The peptide epitopes can be used to enhance immune
conservation of the immunogens administered with the peptides.
 Diseases which can be treated using immunogenic mixtures include prostate cancer, hepatitis B, hepatitis C, AIDS, renal carcinoma, cervical carcinoma, lymphoma, and condylona acuminatum. The peptides may also be used to make monoclonal antibodies useful as potential diagnostic or therapeutic agents. The peptides may also be useful as diagnostic reagents, for example, to determine the susceptibility of an individual to a treatment regimen. Also, the peptides may be used to predict which individuals will be at substantial risk of developing chronic infection. The selection of appropriate T and B cell epitopes should allow the development of epitope based vaccines particularly towards conserved epitopes of pathogens which are characterized by high sequence variability such as HIV, HCV and Malaria.

The invention relates to novel nucleic acids encoding novel human foetal antigens. The nucleic acids and proteins are used to prevent, treat (e.g. by gene therapy) or anallocate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. The antibodies to the antigens can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunoassays (ELISA). Disorders which are diagnosed or treated immunoaschamune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, system disorders e.g. cardiac arrest, viruses and fungiand ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to
 prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be us a food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors and other nutritional components. Numerous examples of diseases and disorders treated by the nucleic acids and
 New polynucleotides and polypeptides for diagnosing, treating, preventing or prognosing e.g. diseases or disorders of the nervous, musculoskeletal, excretory, gastrointestinal, reproductive, and
 proteins are given in the specification. The present sequence

```
Senopus laevis. (I) has dermatological activity, and can be used in gene therapy and for vaccines. (I) and the protein it encodes may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PKD3 expression, such as skin diseases and disorders affecting epithelial tissue. For example, (I) (and vectors containing affecting epithelial tissue. For example, (I) (and vectors containing the PKD3 polypeptide may be used to treat disorders associated with decreased PKD3 expression by rectifying mutations or deletions in a patient's genome that affect the activity of PKD3 by expressing included recombinant DNA methodology, by inserting the nucleic acids to standard recombinant DNA methodology, by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples, and hence which patients may be used of restorative therapy. The PKD3 polypeptides may be used as antigens in the production of antibodies against PKD3 and in assays to identify modulators (agonists and antagonists) of PKP3 expression and activity. The anti-PKP3 antibodies may also be used as diagnostic agents for detecting the presence of PKP3 capulate PKP3 as a catenin-like protein, which is present in desmosomes and nuclei of epithelial cells. The present sequence represents human invention of the present shuman invention of the present the

The present invention provides the protein and coding sequences of a number of human reproductive system related antigens. These can be used in the prevention and treatment of reproductive system disorders, including cancer. The present sequence is a protein of the invention.
 Isolated nucleic acid molecule encoding a reproductive system antigen is used in preventing, treating or ameliorating a medical condition

 The present invention describes a method for identifying a bacteriophage coding region encoding a product active on an essential bacterial target. The method comprises identifying a nucleic acid sequence encoding a gene product that provides a bacteria-inhibiting function when an uncharacterised bacteriophage infects a pathogenic bacterium. The compound active on a target of a bacteriophage inhibitor protein in a bacteria is used to treat or prevent a bacterial infection in an animal. AAA68243 to AAA69442 and AAB16523 to AAB16954 represent bacteriophage nucleotide and protein sequences which are used in the exemplification of the present invention.
 Identifying a bacteriophage coding region for treating bacterial infections comprises identifying a nucleic acid encoding a product that inhibits bacteria when a bacteriophage infects a bacterium

ANH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the used to produce the used to produce hosts calls which express the containing them which are used to produce hosts cells which express the polypeptides. (II) (and/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to sasay for other inhibitors of their activity and therefore identify compounds that may be used for the treatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AAH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AAH55091 to AAH55091 represent oligonucleotide sequences and primers which are used in the exemplification of the present invention.

N.B. The present invention specifically claims all the polynucleotide sequences given in the sequence listing of the present specification, however the sequence listing only goes up to SEQ ID NO:4455 to 4472, no sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,

 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
AAA05803 to AAA05872 encode proteins, polypeptides and peptides (given in AAY91275 to AAY91343) isolated from Group B Streptococcus (GBS), alsknown as Streptococcus agalactiae. The GBS polynucleotides and polypeptides have antibacterial activity. Immunogenic compositions comprising GBS polynucleotides or polypeptides can be used as vaccines and for the treatment or prophylaxis of GBS infection. The polynucleotides and polypeptides can also be used in the detection of G and for screening DNA encoding bacterial cell envelope associated or secreted antigens in gram positive bacteria. AAA05873 to AAA05941 represent primers used in the exemplification of the present invention.
